Dear Xenia Scholl,

My name in Ankith Manjunath. I am a keen software engineer who invests efforts & time to get things implemented in an ethical and quality-oriented way. I have nearly 3 years of experience in the autonomous driving sector. As the applications of autonomous driving are plenty, I wish to gain experience in the logistics sector where autonomous driving has plenty of potentials.

The previous 2 projects on autonomous driving with car OEM'S exposed me to various aspects of software development. The projects helped me gain technical, non-technical, quality and pragmatic aspects which are necessary to develop a functionality. I am a core believer of high-quality software which I learnt from my experiences. The necessity of high-quality software made me and my team, work towards a test-driven-development approach for developing functionalities. The test-driven development ensured that bugs were caught early on the development cycle, This also led to reduced bugs in the later testing stages including vehicle testing.

I believe my experience would help in Aitonomi pursuit for autonomous driving in the logistics sector. I am keen on gaining experience of autonomous driving in unstructured environments application for logistics. My current experience starting from customer requirement analysis to design, testing and validating using C++ & ROS in the vehicle would be beneficial in this regard. Please refer to my resume for more details.

Thank you for considering my application to the position of Softwareentwickler-C++/Python/ROS. I would be interested in discussing the plans of Aitonomi and my areas of contribution. I am always looking for challenging environments where I can develop my technical and soft skills. Looking forward to hearing from you. I would be available in the mentioned email address if any questions come up.

Sincerely,

Ankith Manjunath
